

具有双重电流并联放大器和降压调节器的三相预驱动器-由硬件控制

查询样品: **DRV8302**

特性

- 工作电源电压范围为 **8V–60V**
- **2.3A** 沉电流 和 **1.7A** 源门驱动电流能力
- 具有可调节增益和抵消补偿的集成双重并联电流放大器。
- 集成降压变换器支持高达**1.5A**的外部负载
- **3** 或 **6 PWM**输入的独立控制
- 支持 **100%** 的占空比的引导门驱动器
- 可编程空载时间以避免外部**FET**直通
- 外部 **MOSFET**的可编程过流保护
- 散热增强型 **56** 引脚 **TSSOP DCA** 封装

应用范围

- **3** 相无刷 **DC** 电机和永磁同步电机
- 呼吸机(**CPAP**)和泵
- 电动自行车, 病床, 轮椅
- 电钻、搅拌机、切碎机

说明

DRV8302 是用于三相电机驱动应用的门驱动器集成电路(IC)。它提供三个半桥驱动器, 每个驱动器能够驱动两个N型MOSFET, 一个是高侧驱动器, 另外一个低侧驱动器。它支持高达**2.3A**的沉电流和**1.7A**源峰值电流并且只需要电压范围在**8到60V**的单电源供电。

DRV8302 使用具有连续补充供电电路的引导门驱动器以支持**100%**的占空比。当高侧FET或者低侧FET被放置在防止电流直通位置时, 门驱动器使用自动握手模式。电流过载时, FET的V_{ds}能感应到它以保护外部功率级。

为了准确测量电流值, **DRV8302** 包括两个并联电流放大器。电流放大器支持双向电流感应并提供高达**3V**的可调节输出补偿。

DRV8302 也是具有可调节输出和开关频率的集成开关模式降压转换器, 它能够支持MCU或者额外系统的供电需要。降压电路能够驱动高达**1.5A**的负载。

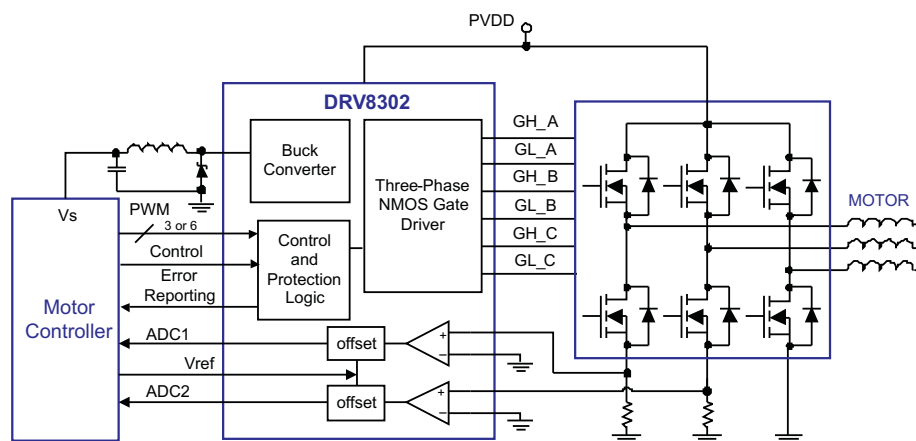

Figure 1. DRV8302 Simplified Application Schematic

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

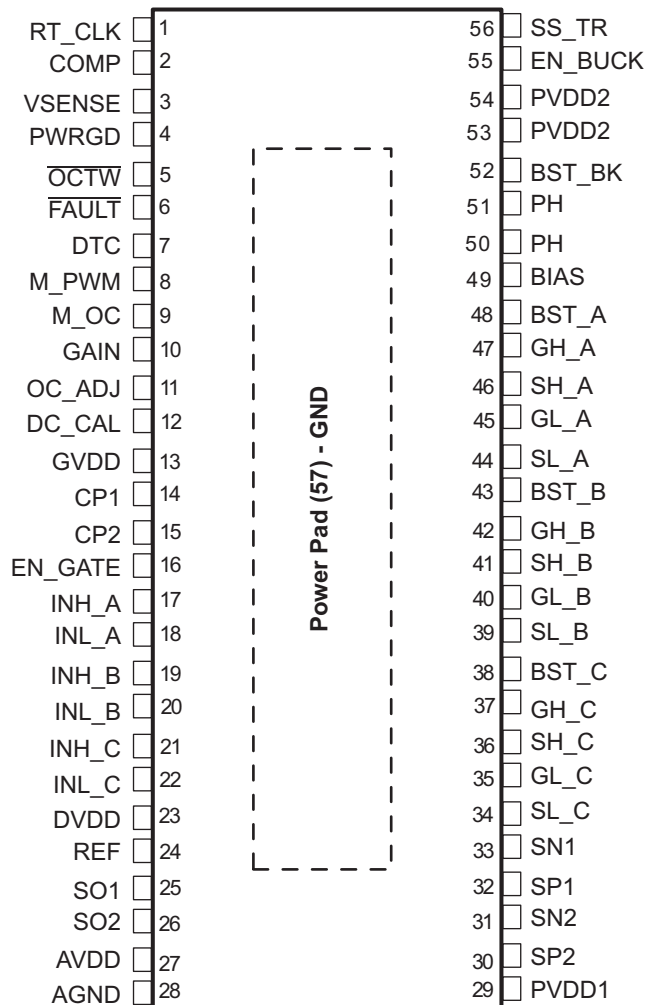

DEVICE INFORMATION

PIN ASSIGNMENT

The DRV8302 is designed to fit the 56pin DCA package. Here is the pinout of the device.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PIN FUNCTIONS

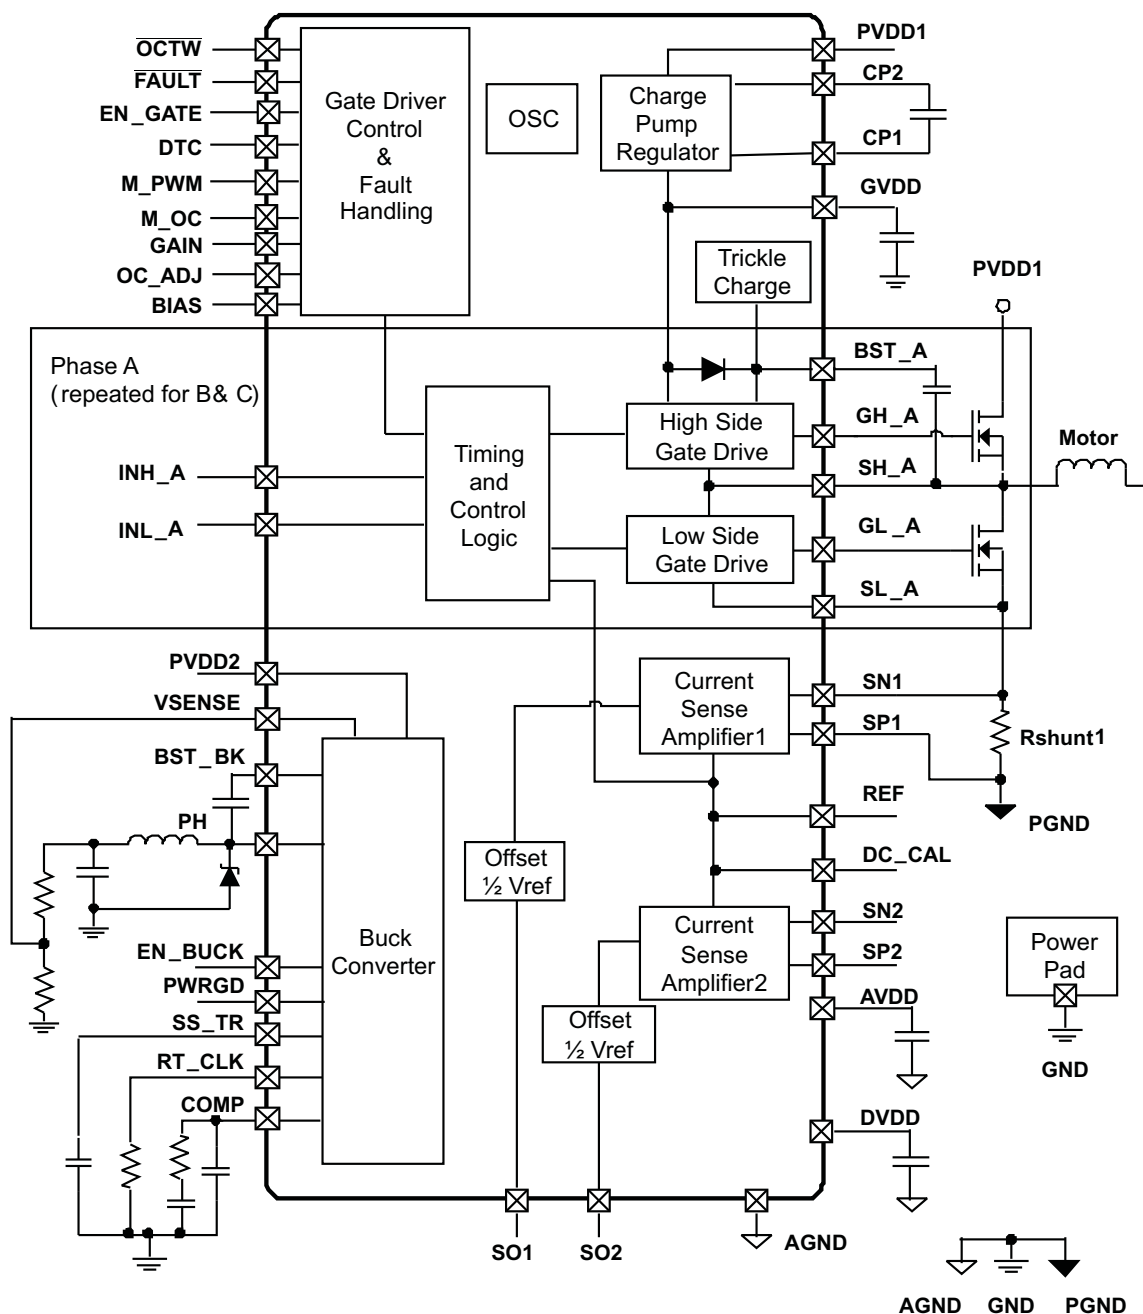

PIN		I/O ⁽¹⁾	DESCRIPTION
NAME	NO.		
RT_CLK	1	I	Resistor timing and external clock for buck regulator. Resistor should connect to GND (power pad) with very short trace to reduce the potential clock jitter due to noise.
COMP	2	O	Buck error amplifier output and input to the output switch current comparator.
VSENSE	3	I	Buck output voltage sense pin. Inverting node of error amplifier.
PWRGD	4	I	An open drain output with external pull-up resistor required. Asserts low if buck output voltage is low due to thermal shutdown, dropout, over-voltage, or EN_BUCK shut down
$\overline{\text{OCTW}}$	5	O	Over current and over temperature warning indicator. This output is open drain with external pull-up resistor required.
$\overline{\text{FAULT}}$	6	O	Fault report indicator. This output is open drain with external pull-up resistor required.
DTC	7	I	Dead-time adjustment with external resistor to GND
M_PWM	8	I	Mode selection pin for PWM input configuration. If M_PWM = LOW, the device supports 6 independent PWM inputs. When M_PWM = HIGH, the device must be connected to ONLY 3 PWM input signals on INH_x. The complementary PWM signals for low side signaling will be internally generated from the high side inputs.
M_OC	9	I	Mode selection pin for over-current protection options. If M_OC = LOW, the gate driver will operate in a cycle-by-cycle current limiting mode. If M_OC = HIGH, the gate driver will shutdown the channel which detected an over-current event.
GAIN	10	O	Gain selection for integrated current shunt amplifiers. If GAIN = LOW, the internal current shunt amplifiers have a gain of 10V/V. If GAIN = HIGH, the current shunt amplifiers have a gain of 40V/V.
OC_ADJ	11	I	Over-current trip set pin. Apply a voltage on this pin to set the trip point for the internal over-current protection circuitry. A voltage divider from DVDD is recommended.
DC_CAL	12	I	When DC_CAL is high, device shorts inputs of shunt amplifiers and disconnects loads. DC offset calibration can be done through external microcontroller.
GVDD	13	P	Internal gate driver voltage regulator. GVDD cap should connect to GND
CP1	14	P	Charge pump pin 1, ceramic cap should be used between CP1 and CP2
CP2	15	P	Charge pump pin 2, ceramic cap should be used between CP1 and CP2
EN_GATE	16	I	Enable gate driver and current shunt amplifiers. Control buck via EN_BUCK pin.
INH_A	17	I	PWM Input signal (high side), half-bridge A
INL_A	18	I	PWM Input signal (low side), half-bridge A
INH_B	19	I	PWM Input signal (high side), half-bridge B
INL_B	20	I	PWM Input signal (low side), half-bridge B
INH_C	21	I	PWM Input signal (high side), half-bridge C
INL_C	22	I	PWM Input signal (low side), half-bridge C
DVDD	23	P	Internal 3.3V supply voltage. DVDD cap should connect to AGND. This is an output, but not specified to drive external circuitry.
REF	24	I	Reference voltage to set output of shunt amplifiers with a bias voltage which equals to half of the voltage set on this pin. Connect to ADC reference in microcontroller.
SO1	25	O	Output of current amplifier 1
SO2	26	O	Output of current amplifier 2
AVDD	27	P	Internal 6V supply voltage, AVDD cap should connect to AGND. This is an output, but not specified to drive external circuitry.
AGND	28	P	Analog ground pin
PVDD1	29	P	Power supply pin for gate driver and current shunt amplifier. PVDD1 is independent of buck power supply, PVDD2. PVDD1 cap should connect to GND
SP2	30	I	Input of current amplifier 2 (connecting to positive input of amplifier). Recommend to connect to ground side of the sense resistor for the best common mode rejection.
SN2	31	I	Input of current amplifier 2 (connecting to negative input of amplifier).
SP1	32	I	Input of current amplifier 1 (connecting to positive input of amplifier). Recommend to connect to ground side of the sense resistor for the best common mode rejection.
SN1	33	I	Input of current amplifier 1 (connecting to negative input of amplifier).

(1) KEY: I =Input, O = Output, P = Power

PIN FUNCTIONS (continued)

PIN		I/O ⁽¹⁾	DESCRIPTION
NAME	NO.		
SL_C	34	I	Low-Side MOSFET source connection, half-bridge C. Low-side V_{DS} measured between this pin and SH_C.
GL_C	35	O	Gate drive output for Low-Side MOSFET, half-bridge C
SH_C	36	I	High-Side MOSFET source connection, half-bridge C. High-side V_{DS} measured between this pin and PVDD1.
GH_C	37	O	Gate drive output for High-Side MOSFET, half-bridge C
BST_C	38	P	Bootstrap cap pin for half-bridge C
SL_B	39	I	Low-Side MOSFET source connection, half-bridge B. Low-side V_{DS} measured between this pin and SH_B.
GL_B	40	O	Gate drive output for Low-Side MOSFET, half-bridge B
SH_B	41	I	High-Side MOSFET source connection, half-bridge B. High-side V_{DS} measured between this pin and PVDD1.
GH_B	42	O	Gate drive output for High-Side MOSFET, half-bridge B
BST_B	43	P	Bootstrap cap pin for half-bridge B
SL_A	44	I	Low-Side MOSFET source connection, half-bridge A. Low-side V_{DS} measured between this pin and SH_A.
GL_A	45	O	Gate drive output for Low-Side MOSFET, half-bridge A
SH_A	46	I	High-Side MOSFET source connection, half-bridge A. High-side V_{DS} measured between this pin and PVDD1.
GH_A	47	O	Gate drive output for High-Side MOSFET, half-bridge A
BST_A	48	P	Bootstrap cap pin for half-bridge A
BIAS	49	I	Bias pin. Connect 1M Ω resistor to GND, or 0.1 μ F capacitor to GND.
PH	50, 51	O	The source of the internal high side MOSFET of buck converter
BST_BK	52	P	Bootstrap cap pin for buck converter
PVDD2	53,54	P	Power supply pin for buck converter, PVDD2 cap should connect to GND.
EN_BUCK	55	I	Enable buck converter. Internal pull-up current source. Pull below 1.2V to disable. Float to enable. Adjust the input undervoltage lockout with two resistors
SS_TR	56	I	Buck soft-start and tracking. An external capacitor connected to this pin sets the output rise time. Since the voltage on this pin overrides the internal reference, it can be used for tracking and sequencing. Cap should connect to GND
GND (POWER PAD)	57	P	GND pin. The exposed power pad must be electrically connected to ground plane through soldering to PCB for proper operation and connected to bottom side of PCB through vias for better thermal spreading.

FUNCTION BLOCK DIAGRAM

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

			VALUE		UNITS
			MIN	MAX	
PVDD	Supply voltage range including transient	Relative to PGND	−0.3	70	V
PVDD _{RAMP}	Maximum supply voltage ramp rate	Voltage rising up to PVDD _{MAX}	50		V/mS
V _{PGND}	Maximum voltage between PGND and GND		±0.3		V
I _{IN_MAX}	Maximum current, all digital and analog input pins except $\overline{\text{FAULT}}$ and $\overline{\text{OCTW}}$ pins		±1		mA
I _{IN_OD_MAX}	Maximum sinking current for open drain pins ($\overline{\text{FAULT}}$ and $\overline{\text{OCTW}}$ Pins)		7		mA
V _{OPA_IN}	Voltage range for SPx and SNx pins		±0.6		V
V _{LOGIC}	Input voltage range for logic/digital pins (INH_A, INL_A, INH_B, INL_B, INH_C, INL_C, EN_GATE, M_PWM, M_OC, OC_ADJ, GAIN, DC_CAL)		−0.3	7	V
V _{GVDD}	Maximum voltage for GVDD Pin		13.2		V
V _{AVDD}	Maximum voltage for AVDD Pin		8		V
V _{DVDD}	Maximum voltage for DVDD Pin		3.6		V
V _{REF}	Maximum reference voltage for current amplifier		7		V
I _{REF}	Maximum current for REF Pin		100		μA
T _J	Maximum operating junction temperature range		−40	150	°C
T _{STORAGE}	Storage temperature range		−55	150	°C
	Capacitive discharge model		500		V
	Human body model		2000		V

- (1) Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

I _{oso1}	Maximum source current setting 1, peak	V _{gs} of FET equals to 2 V. REG 0x02		1.7		A
I _{osi1}	Maximum sink current setting 1, peak	V _{gs} of FET equals to 8 V. REG 0x02		2.3		A
R _{gate_off}	Gate output impedance during standby mode when EN_GATE low (pins GH_x, GL_x)		1.6		2.4	kΩ
SUPPLY CURRENTS						
I _{PVDD1_STB}	PVDD1 supply current, standby	EN_GATE is low. PVDD1 = 8V.		20	50	μA
I _{PVDD1_OP}	PVDD1 supply current, operating	EN_GATE is high, no load on gate drive output, switching at 10 kHz, 100 nC gate charge		15		mA
I _{PVDD1_HIZ}	PVDD1 Supply current, HiZ	EN_GATE is high, gate not switching	2	5	11	mA
INTERNAL REGULATOR VOLTAGE						
A _{VDD}	AVDD voltage		6	6.5	7	V
D _{VDD}	DVDD voltage		3	3.3	3.6	V
VOLTAGE PROTECTION						
V _{PVDD_UV}	Under voltage protection limit, PVDD				6	V
V _{GVDD_UV}	Under voltage protection limit, GVDD				8	V
V _{GVDD_OV}	Over voltage protection limit, GVDD				16	V
CURRENT PROTECTION, (VDS SENSING)						
V _{DS_OC}	Drain-source voltage protection limit		0.125		2.4	V
T _{oc}	OC sensing response time			1.5		μs
T _{OC_PULSE}	$\overline{\text{OCTW}}$ pin reporting pulse stretch length for OC event			64		μs

GATE TIMING AND PROTECTION CHARACTERISTICS

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
TIMING, OUTPUT PINS						
$t_{pd,lf-O}$	Positive input falling to GH_x falling	CL=1nF, 50% to 50%		45		ns
$t_{pd,lr-O}$	Positive input rising to GL_x falling	CL=1nF, 50% to 50%		45		ns
T_{d_min}	Minimum dead time after hand shaking ⁽¹⁾				50	ns
T_{dtp}	Dead Time	With R_{DTC} set to different values	50		500	ns
t_{GDr}	Rise time, gate drive output	CL=1nF, 10% to 90%		25		ns
t_{GDF}	Fall time, gate drive output	CL=1nF, 90% to 10%		25		ns
T_{ON_MIN}	Minimum on pulse	Not including handshake communication. Hiz to on state, output of gate driver			50	ns
T_{pd_match}	Propagation delay matching between high side and low side				5	ns
T_{dt_match}	Deadtime matching				5	ns
TIMING, PROTECTION AND CONTROL						
$t_{pd,R_GATE-OP}$	Start up time, from EN_GATE active high to device ready for normal operation	PVDD is up before start up, all charge pump caps and regulator caps as in recommended condition		5	10	ms
$t_{pd,R_GATE-Quick}$	If EN_GATE goes from high to low and back to high state within quick reset time, it will only reset all faults and gate driver without powering down charge pump, current amp, and related internal voltage regulators.	Maximum low pulse time			10	us
$t_{pd,E-L}$	Delay, error event to all gates low			200		ns
$t_{pd,E-FAULT}$	Delay, error event to \overline{FAULT} low			200		ns
OTW_CLR	Junction temperature for resetting over temperature warning			115		°C
OTW_SET/OTSD_CLR	Junction temperature for over temperature warning and resetting over temperature shut down			130		°C
OTSD_SET	Junction temperature for over temperature shut down			150		°C

- (1) Dead time programming definition: Adjustable delay from GH_x falling edge to GL_X rising edge, and GL_X falling edge to GH_X rising edge. This is a minimum dead-time insertion. It is not added to the value set by the microcontroller externally.

CURRENT SHUNT AMPLIFIER CHARACTERISTICS

$T_C = 25^\circ\text{C}$ unless otherwise specified

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
G1	Gain option 1	(GAIN = 0V)	9.5	10	10.5	V/V
G2	Gain Option 2	(GAIN = 2V)	38	40	42	V/V
Tsettling	Settling time to 1%	$T_C = 0\text{--}60^\circ\text{C}$, $G = 10$, $V_{\text{step}} = 2\text{ V}$		300		ns
Tsettling	Settling time to 1%	$T_C = 0\text{--}60^\circ\text{C}$, $G = 40$, $V_{\text{step}} = 2\text{ V}$		1.2		μs

PWRGD	V _{SENSE} threshold	V _{SENSE} falling		92%		
		V _{SENSE} rising		94%		
		V _{SENSE} rising		109%		
		V _{SENSE} falling		107%		
	Hysteresis	V _{SENSE} falling		2%		
	Output high leakage	$V_{\text{SENSE}} = V_{\text{REF}}$, $V(\text{PWRGD}) = 5.5\text{ V}$, 25°C		10		nA
	On resistance	$I(\text{PWRGD}) = 3\text{ mA}$, $V_{\text{SENSE}} < 0.79\text{ V}$		50		Ω

FUNCTIONAL DESCRIPTION

THREE-PHASE GATE DRIVER

The DRV8302 provides three half bridge drivers, each capable of driving two N-type MOSFETs, one for the high-side and one for the low side.

Gate driver has following features:

- Internal hand shake between high side and low side FETs during switching transition to prevent current shoot through.
- Support up to 200kHz switching frequency with $Q_g(TOT)=25nC$ or total 30mA gate drive average current
- Provide cycle-by-cycle current limiting and latch over-current (OC) shut down of external FETs. Current is sensed through FET drain-to-source voltage and the over-current level is programmable through OC_ADJ pin
- High side gate drive will survive negative output from half bridge up to $-10V$ for 10ns
- During EN_GATE pin low and fault conditions, gate driver will keep external FETs in high impedance mode.
- Programmable dead time through DTC pin. Dead time control range: 50ns to 500ns. Short DTC pin to ground will provide minimum dead time (50ns). External dead time will override internal dead time as long as the time is longer than the dead time setting (minimum hand shake time cannot be reduced in order to prevent shoot through current).
- Bootstraps are used in high side FETs of three-phase pre-gate driver. Trickle charge circuitry is used to replenish current leakage from bootstrap cap and support 100% duty cycle operation.

CURRENT SHUNT AMPLIFIERS

The DRV8302 includes two high performance current shunt amplifiers for accurate current measurement. The current amplifiers provide output offset up to 3V to support bi-directional current sensing.

Current shunt amplifier has following features:

- Programmable gain: 2 gain settings through GAIN pin
- Programmable output offset through reference pin (half of the Vref)
- Minimize DC offset and drift over temperature with dc calibrating through DC_CAL pin. When DC calibration is enabled, device will short input of current shunt amplifier and disconnect the load. DC calibrating can be done at anytime even when FET is switching since the load is disconnected. For best result, perform the DC calibrating during switching off period when no load is present to reduce the potential noise impact to the amplifier.

The output of current shunt amplifier can be calculated as:

$$V_O = \frac{V_{REF}}{2} - G \times (SN_x - SP_x) \quad (1)$$

Where Vref is the reference voltage, G is the gain of the amplifier; SN_x and SP_x are the inputs of channel x. SP_x should connect to resistor ground for the best common mode rejection.

Figure 2 shows current amplifier simplified block diagram.

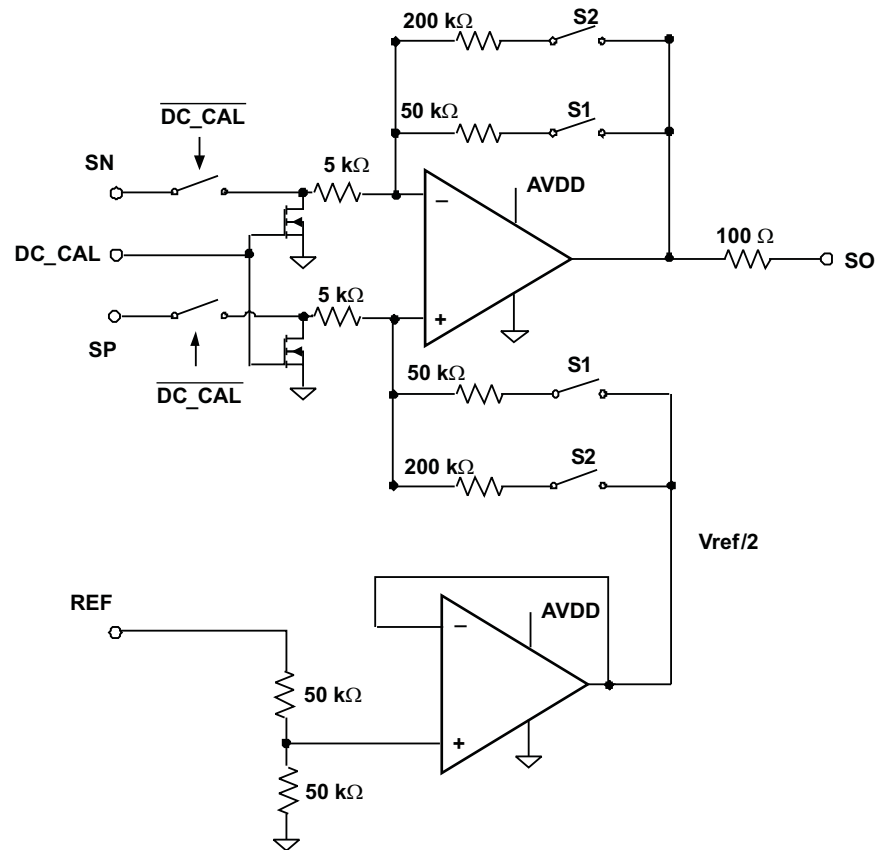

Figure 2. Current Shunt Amplifier Simplified Block Diagram

BUCK CONVERTER

Although integrated in the same device, buck converter is designed completely independent of rest of the gate driver circuitry. Since buck will support external MCU or other external power need, the independency of buck operation is very critical for a reliable system; this will give buck minimum impact from gate driver operations. Some examples are: when gate driver shuts down due to any failure, buck will still operate unless the fault is coming from buck itself. The buck keeps operating at much lower PVDD of 3.5V, this will assure the system to have a smooth power up and power down sequence when gate driver is not able to operate due to a low PVDD.

The buck has an integrated high side n-channel MOSFET. To improve performance during line and load transients the device implements a constant frequency, current mode control which reduces output capacitance and simplifies external frequency compensation design.

The wide switching frequency of 450kHz to 720kHz allows for efficiency and size optimization when selecting the output filter components. The switching frequency is adjusted using a resistor to ground on the RT_CLK pin.

The buck converter has a default start up voltage of approximately 2.5V. The EN_BUCK pin has an internal pull-up current source that can be used to adjust the input voltage under voltage lockout (UVLO) threshold with two external resistors. In addition, the pull up current provides a default condition. When the EN_BUCK pin is floating the device will operate. The operating current is 116μA when not switching and under no load. When the device is disabled, the supply current is 1.3μA.

The integrated 200mΩ high side MOSFET allows for high efficiency power supply designs capable of delivering 1.5 amperes of continuous current to a load. The bias voltage for the integrated high side MOSFET is supplied by a capacitor on the BOOT to PH pin. The boot capacitor voltage is monitored by an UVLO circuit and will turn the high side MOSFET off when the boot voltage falls below a preset threshold. The buck can operate at high duty cycles because of the boot UVLO. The output voltage can be stepped down to as low as the 0.8V reference.

The buck has a power good comparator (PWRGD) which asserts when the regulated output voltage is less than 92% or greater than 109% of the nominal output voltage. The PWRGD pin is an open drain output which deasserts when the VSENSE pin voltage is between 94% and 107% of the nominal output voltage allowing the pin to transition high when a pull-up resistor is used.

The buck minimizes excessive output overvoltage (OV) transients by taking advantage of the OV power good comparator. When the OV comparator is activated, the high side MOSFET is turned off and masked from turning on until the output voltage is lower than 107%.

The SS_TR (slow start/tracking) pin is used to minimize inrush currents or provide power supply sequencing during power up. A small value capacitor should be coupled to the pin to adjust the slow start time. A resistor divider can be coupled to the pin for critical power supply sequencing requirements. The SS_TR pin is discharged before the output powers up. This discharging ensures a repeatable restart after an over-temperature fault,

The buck, also, discharges the slow start capacitor during overload conditions with an overload recovery circuit. The overload recovery circuit will slow start the output from the fault voltage to the nominal regulation voltage once a fault condition is removed. A frequency foldback circuit reduces the switching frequency during startup and overcurrent fault conditions to help control the inductor current.

PROTECTION FEATURES

Power Stage Protection

The DRV8302 provides over-current and under-voltage protection for the MOSFET power stage. During fault shut down conditions, all gate driver outputs will be kept low to ensure external FETs at high impedance state.

Over-Current Protection (OCP) and Reporting

To protect the power stage from damage due to high currents, a V_{DS} sensing circuitry is implemented in the DRV8302. Based on $R_{DS(on)}$ of the power MOSFETs and the maximum allowed I_{DS} , a voltage threshold can be calculated which, when exceeded, triggers the OC protection feature. This voltage threshold level is programmable through the OC_ADJ terminal (see next section) by applying an external reference voltage with a DAC or resistor divider from DVDD.

There are a total of 2 OC_MODE settings selectable with the M_OC pin.

1. Current Limit Mode (M_OC = LOW)

When current limit mode is enabled, device operates current limiting instead of OC shut down during OC event. During OC event, the FET that detected OC will turn off until next PWM cycle. The over-current event is reported through OCTW pin. OCTW reporting should hold low during same PWM cycle or for a max 64μs period (internal timer) so external controller has enough time to sample the warning signal. If in the middle of reporting, other FET(s) gets OC, then OCTW reporting will hold low and recount another 64μs unless PWM cycles on both FETs are ended.

2. OC latch shut down mode (M_OC = HIGH)

When OC occurs, device will turn off both high side and low side FETs in the same phase if any of the FETs in that phase has OC.

OC_ADJ

When external MOSFET is turned on, the output current flows through the on resistance, $R_{DS(on)}$ of the MOSFET, which creates a voltage drop V_{DS} . The over current protection event will be enabled when the V_{DS} exceeds a pre-set value. The voltage on OC_ADJ pin will be used to pre-set the OC tripped value. The OC tripped value I_{OC} has to meet following equations:

$$\frac{R_2}{(R_1 + R_2)} \times DVDD = V_{DS} \quad (2)$$

$$I_{OC} = \frac{V_{DS}}{R_{DS(on)}} \quad (3)$$

Where

$$R1 + R2 \geq 100 \text{ K}\Omega$$

$$DVDD = 3.3 \text{ V}$$

Connect OC_ADJ pin to DVDD to disable the over-current protection feature.

Figure 3. OC_ADJ Current Programming Pin Connection

Under-Voltage Protection (UVP)

To protect the power output stage during startup, shutdown and other possible under-voltage conditions, the DRV8302 provides power stage under-voltage protection by driving its outputs low whenever PVDD is below 6V (PVDD_UV) or GVDD is below 8V (GVDD_UV). When UVP is triggered, the DRV8302 outputs are driven low and the external MOSFETs will go to a high impedance state.

Over-Voltage Protection (GVDD_OV)

Device will shut down both gate driver and charge pump if GVDD voltage exceeds 16V to prevent potential issue related to GVDD or charge pump (e.g. short of external GVDD cap or charge pump). The fault is a latched fault and can only be reset through a transition on EN_GATE pin.

Over-Temperature Protection

A two-level over-temperature detection circuit is implemented:

- Level 1: over temperature warning (OTW)
OTW is reported through $\overline{\text{OCTW}}$ pin.
- Level 2: over temperature (OT) latched shut down of gate driver and charge pump (OTSD_GATE)
Fault will be reported to $\overline{\text{FAULT}}$ pin. This is a latched shut down, so gate driver will not be recovered automatically even if OT condition is not present anymore. An EN_GATE reset through pin is required to recover gate driver to normal operation after temperature goes below a preset value, $t_{\text{OTSD_CLR}}$.

Fault and Protection Handling

The $\overline{\text{FAULT}}$ pin indicates an error event with shut down has occurred such as over-current, over-temperature, over-voltage, or under-voltage. Note that $\overline{\text{FAULT}}$ is an open-drain signal. $\overline{\text{FAULT}}$ will go high when gate driver is ready for PWM signal (internal EN_GATE goes high) during start up.

The $\overline{\text{OCTW}}$ pin indicates an over temperature or over current event that is not necessarily related to shut down.

Following is the summary of all protection features and their reporting structure:

Table 1. Fault and Warning Reporting and Handling

EVENT	ACTION	LATCH	REPORTING ON FAULT PIN	REPORTING ON OCTW PIN
PVDD undervoltage	External FETs HiZ; Weak pull down of all gate driver output	N	Y	N
DVDD undervoltage	External FETs HiZ; Weak pull down of all gate driver output; When recovering, reset all status registers	N	Y	N
GVDD undervoltage	External FETs HiZ; Weak pull down of all gate driver output	N	Y	N
GVDD overvoltage	External FETs HiZ; Weak pull down of all gate driver output Shut down the charge pump Won't recover and reset through SPI reset command or quick EN_GATE toggling	Y	Y	N
OTW	None	N	N	Y
OTSD_GATE	Gate driver latched shut down. Weak pull down of all gate driver output to force external FETs HiZ Shut down the charge pump	Y	Y	Y
OTSD_BUCK	OTSD of Buck	Y	N	N
Buck output undervoltage	UVLO_BUCK: auto-restart	N	Y, in PWRGD pin	N
Buck overload	Buck current limiting (HiZ high side until current reaches zero and then auto-recovering)	N	N	N
External FET overload – current limit mode	External FETs current Limiting (only OC detected FET)	N	N	Y
External FET overload – Latch mode	Weak pull down of gate driver output and PWM logic "0" of LS and HS in the same phase. External FETs HiZ	Y	Y	Y
External FET overload – reporting only mode	Reporting only	N	N	Y

PIN CONTROL FUNCTIONS

EN_GATE

EN_GATE low is used to put gate driver, charge pump, current shunt amplifier, and internal regulator blocks into a low power consumption mode to save energy. Device will put the MOSFET output stage to high impedance mode as long as PVDD is still present.

When EN_GATE pin goes to high, it will go through a power up sequence, and enable gate driver, current amplifiers, charge pump, internal regulator, etc and reset all latched faults related to gate driver block. All latched faults can be reset when EN_GATE is toggled after an error event unless the fault is still present.

When EN_GATE goes from high to low, it will shut down gate driver block immediately, so gate output can put external FETs in high impedance mode. It will then wait for 10 μ s before completely shutting down the rest of the blocks. A quick fault reset mode can be done by toggling EN_GATE pin for a very short period (less than 10 μ s). This will prevent device to shut down other function blocks such as charge pump and internal regulators and bring a quicker and simple fault recovery.

One exception is to reset a GVDD_OV fault. A quick EN_GATE quick fault reset won't work with GVDD_OV fault. A complete EN_GATE with low level holding longer than 10 μ s is required to reset GVDD_OV fault. It is highly recommended to inspect the system and board when GVDD_OV occurs.

EN_BUCK

Buck enable pin, internal pull-up current source. Pull below 1.2 V to disable. Float to enable.

DTC

Dead time can be programmed through DTC pin. A resistor should be connected from DTC to ground to control the dead time. Dead time control range is from 50ns to 500ns. Short DTC pin to ground will provide minimum dead time (50ns). Resistor range is 0 to 150k Ω . Dead time is linearly set over this resistor range.

Current shoot through prevention protection will be enabled in the device all time independent of dead time setting and input mode setting.

DC_CAL

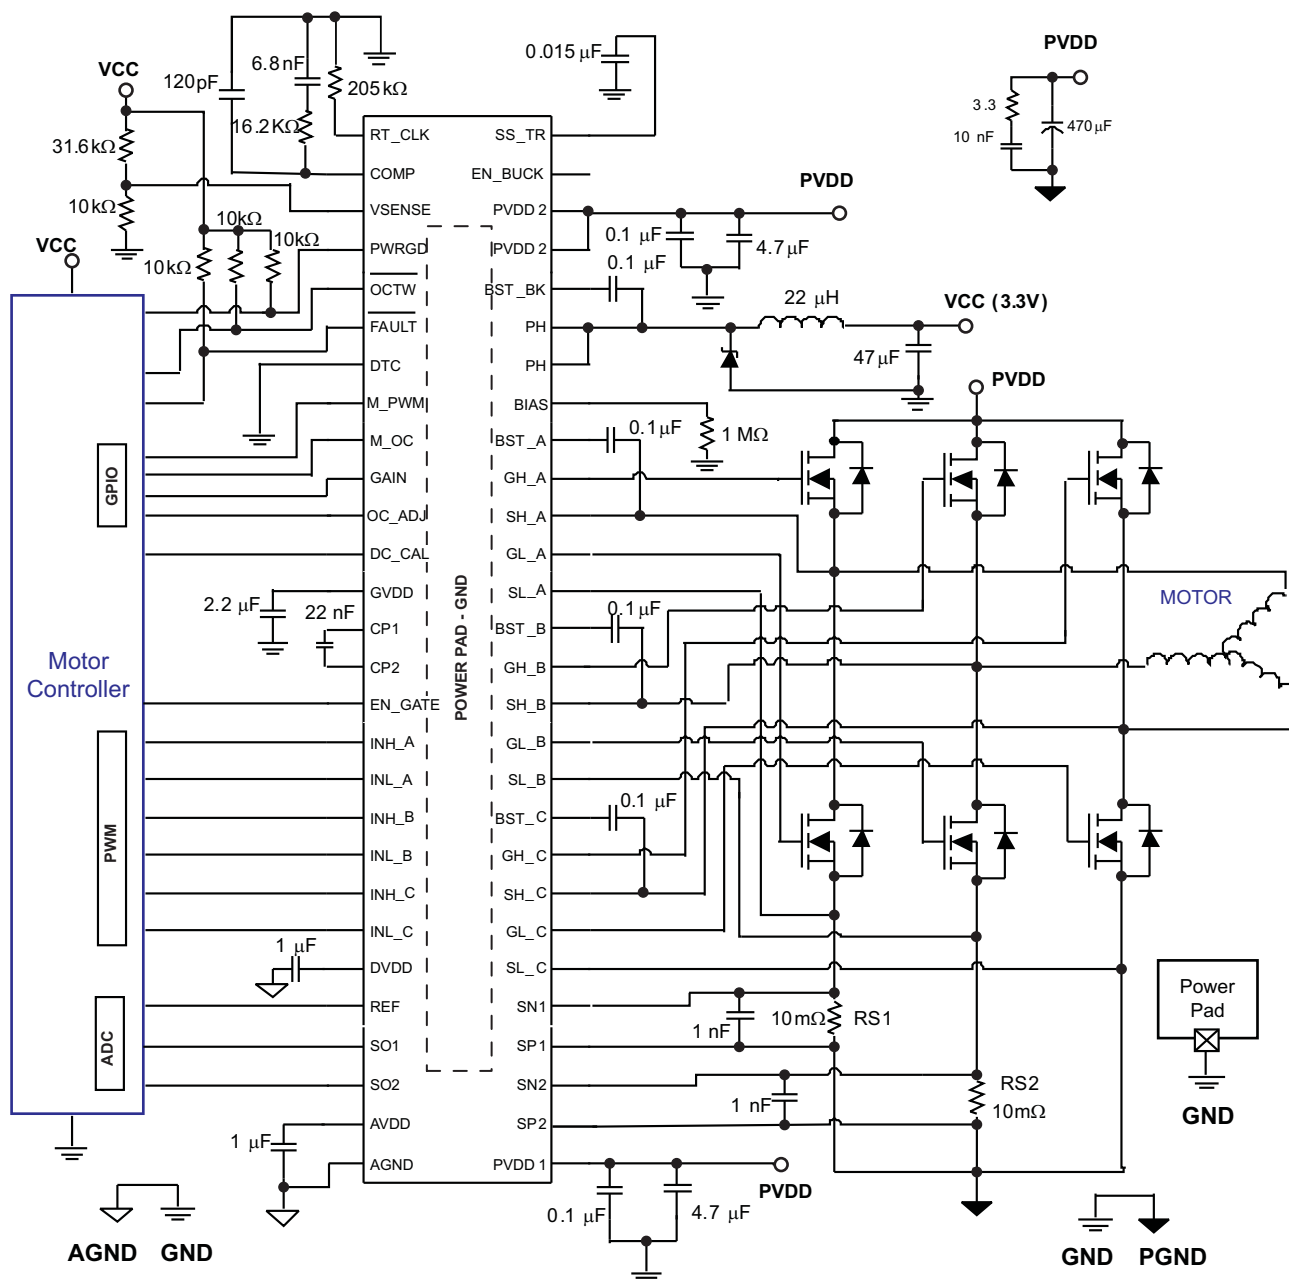

When DC_CAL is enabled, device will short inputs of shunt amplifier and disconnect from the load, so external microcontroller can do a DC offset calibration.

STARTUP AND SHUTDOWN SEQUENCE CONTROL

During power-up all gate drive outputs are held low. Normal operation of gate driver and current shunt amplifiers can be initiated by toggling EN_GATE from a low state to a high state. If no errors are present after a 10-ms wait time, the DRV8302 is ready to accept PWM inputs. Gate driver always has control of the power FETs even in gate disable mode as long as PVDD is within functional region.

Example:

Buck: PVDD= 3.5V – 40V, Iout_max = 1.5A, Vo = 3.3V, Fs = 570 kHz

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Top-Side Markings (4)	Samples
DRV8302DCA	ACTIVE	HTSSOP	DCA	56	35	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 125	DRV8302	Samples
DRV8302DCAR	ACTIVE	HTSSOP	DCA	56	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 125	DRV8302	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

PowerPAD™ PLASTIC SMALL-OUTLINE

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - Body dimensions do not include mold flash or protrusion not to exceed 0.15.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - Falls within JEDEC MO-153

PowerPAD is a trademark of Texas Instruments.

DCA (R-PDSO-G56)

PowerPAD™ PLASTIC SMALL OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

4206320-15/R 03/13

NOTES: A. All linear dimensions are in millimeters

 Keep-out features are identified to prevent board routing interference. These exposed metal features may vary within the identified area or completely absent on some devices.

PowerPAD is a trademark of Texas Instruments.

重要声明

德州仪器(TI) 及其下属子公司有权根据 JESD46 最新标准, 对所提供的产品和服务进行更正、修改、增强、改进或其它更改, 并有权根据 JESD48 最新标准中止提供任何产品和服务。客户在下订单前应获取最新的相关信息, 并验证这些信息是否完整且是最新的。所有产品的销售都遵循在订单确认时所提供的TI 销售条款与条件。

TI 保证其所销售的组件的性能符合产品销售时 TI 半导体产品销售条件与条款的适用规范。仅在 TI 保证的范围内, 且 TI 认为 有必要时才会使用测试或其它质量控制技术。除非适用法律做出了硬性规定, 否则没有必要对每种组件的所有参数进行测试。

TI 对应用帮助或客户产品设计不承担任何义务。客户应对其使用 TI 组件的产品和应用自行负责。为尽量减小与客户产品和应用相关的风险, 客户应提供充分的设计与操作安全措施。

TI 不对任何 TI 专利权、版权、屏蔽作品权或其它与使用了 TI 组件或服务的组合设备、机器或流程相关的 TI 知识产权中授予 的直接或隐含权限作出任何保证或解释。TI 所发布的与第三方产品或服务有关的信息, 不能构成从 TI 获得使用这些产品或服务 的许可、授权、或认可。使用此类信息可能需要获得第三方的专利权或其它知识产权方面的许可, 或是 TI 的专利权或其它 知识产权方面的许可。
